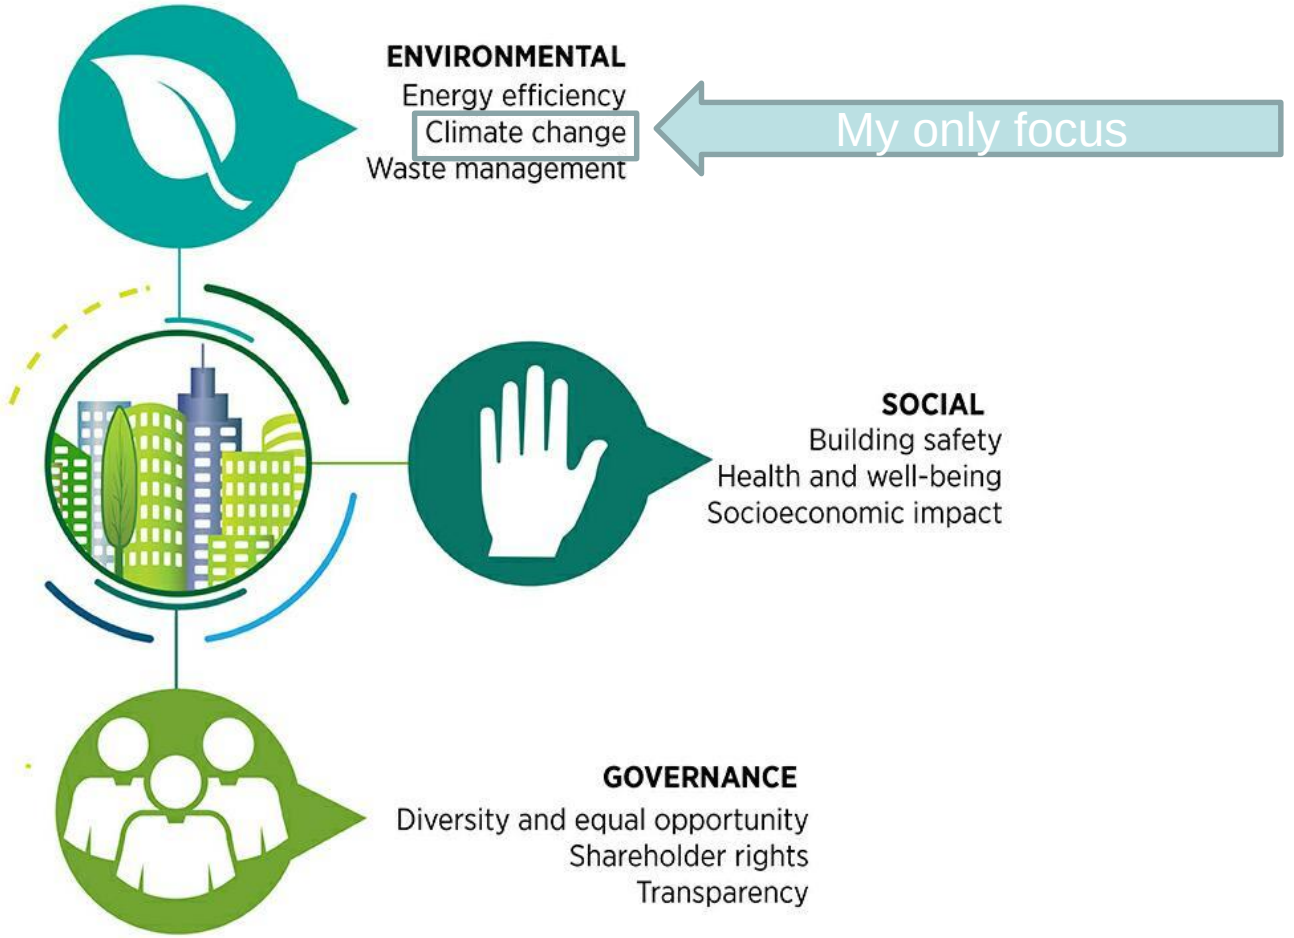
Climate-related risk in the Italian financial system

Ivan Faiella[*]

* *Banca d'Italia, Dipartimento economia e statistica*. *Le opinioni espresse sono personali e non implicano in alcun modo quelle della Banca d'Italia*

Sustainability is a very complex concept



Yes we focus on climate change but…

1. … I focus on *climate related financial risk*
2. … I need to (relatively) limit the boundaries of the analysis
3. … even the Interim Report of the HLEG and the Sustainable Finance Action Plan use the same strategy
4. … "It **is very hard to be against sustainability.** In fact, the less you know about it, the better it sounds." (Robert Solow, 1991)

Why in ESG analysis the "S" is more neglected than the "E"

Climate change in ITALY

In italia il 2018 è stato, ad oggi, l'anno più caldo. ISPRA fa il punto sul clima e fornisce una sintesi di dati su piogge e venti che nel mese di ottobre hanno colpito il nostro Paese

Mi piace 0 Tweet

Stampa

La stima provvisoria dell'anomalia della temperatura media in Italia, stando ai dati aggiornati fino al mese di ottobre compreso, configura il 2018 come l'anno più caldo di tutta la serie storica di dati controllati ed elaborati dall'Ispra, cioè almeno dal 1961 (+1,77 °C rispetto al valore normale di riferimento 1961-1990). In base a studi che ricostruiscono il clima in un passato più remoto, si può affermare che in Italia l'anno in corso risulta essere l'anno più caldo da almeno 2 secoli circa. Finora, la temperatura media in Italia nel 2018 è stata sempre nettamente superiore al valore normale ad eccezione dei mesi di febbraio e marzo; i mesi relativamente più caldi sono stati gennaio e aprile, con anomalie di oltre 2,5 °C.

How climate change affects the economy

Climate change impacts

Source: American Climate Prospectus (2014)

Carbon risk or *carbon uncertainty?*

1. How climate change is going to affect our economy is still unclear (Through productivity in a persistent way? With consecutive shocks because of extreme-weather event?)
2. This uncertainty on the effects is amplified by the uncertainty in the climate policies (see how Germany is now prudent on tightening EU carbon targets or the unpredictability of the EU ETS/carbon tax on non-ETS sectors).

But…

… and we need more climate intelligence

…in the dark all the Swans are black

How does climate change affect the financial system

Carbon emissions generate climate risk …

- The atmosphere's capacity to safely absorb emissions is limited (**carbon budget**)
- From an economic perspective that capacity is a scarce resource that is being wasted (it is a **non-priced sink service**)

… in turn climate risk can increase financial risk generating climate-related financial risk - CRFR

1. **Physical risks**, direct (e.g. on property and casualties) and indirect (e.g. on economic activity) effects of climate-related events, such as floods and storms;
2. **Transition risks**, sudden (unexpected) devaluation of carbon-intensive financial assets and infrastructure as a consequence of climate policies that aim at the decarbonization of the energy sector (the so-called Carbon Bubble/Stranded Assets issue);
3. **Liability risks**, insured parties having suffered loss from climate-related events seek to recover losses from insurance firms under third-party liability contracts (e.g. Tobacco, Asbestos, Deepwater horizon accident).

Examples of CRFR* for Italian banks

	Market risk	Credit risk
Physical risk	• Losses from a reduction in the value of assets owned by the bank (dwellings, land, etc) and damaged by climate-induced extreme weather events • Losses from a reduction in the value of shares/bonds in the bank portfolio issued by firms whose performance is affected by climate change material effects (eg. because less productive, energy-water dependent, etc…)	• Extreme weather events affect the output of firms/households and make them more financial vulnerable therefore reducing their ability to repay their debts • Extreme weather events affect the value of the collateral of indebted firms/households. If losses are uninsured possible systemic effects in the affected areas with spillover on the local banking system
Transition risk	• Losses/Profits from a reduction/increase in the value of shares/bonds/assets in the bank portfolio issued by firms whose future performance is affected by climate change policies (eg. Coal generating utilities, energy intensive companies, companies operating in the oil and gas sector, Recent policies to limit land use)	• Losses from due to the non-performing loans from firms whose future performance is affected by climate change policies (eg. Coal generating utilities, energy intensive companies, companies operating in the oil and gas sector).
Systemic risk	• If the effects (in particular of transition risk) are affecting a whole sector (constructions, energy production and distribution, agriculture, etc) there is a risk of spillover effect across all the financial system	

* I skip **liability risk**

UN environment

LOOKING AHEAD

The National Dialogue on Sustainable Finance has generated a broad-based agenda for market innovation and policy reform.

At the domestic level, it is important to maintain and deepen the momentum. This can be done by establishing a National Observatory on Sustainable Finance, which could assure the continuation of the work started by the Dialogue, particularly through the promotion, coordination and monitoring of suggested options. It would also encourage all actors in the financial community to make the Italian

FINANCING THE FUTURE
Report of the Italian National Dialogue on Sustainable Finance

ONFS established 4 workstreams

1 - Financial Centres for Sustainability

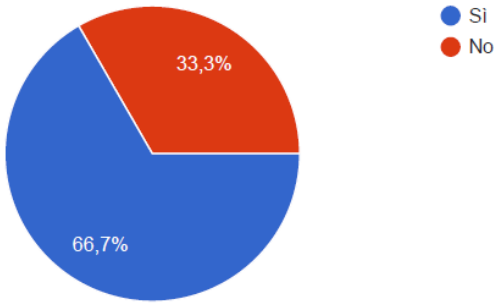
2 - Green Finance for Reindustrialization

3 - International Dimension

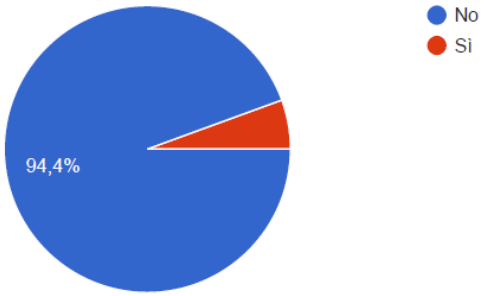
4 - Monitoring progress

ONFS – The WG3 Survey (two examples)

Over the past 5 years have you raised the level of attention to environmental risks, particularly those related to climate change, affecting on your activities?



In managing your portfolio you assess the impact on your investments under different emission scenarios (including a scenario with policies to maintain the increase in temperatures within 2°C compared to pre-industrial values)?



Some empirical research at the Bank of Italy

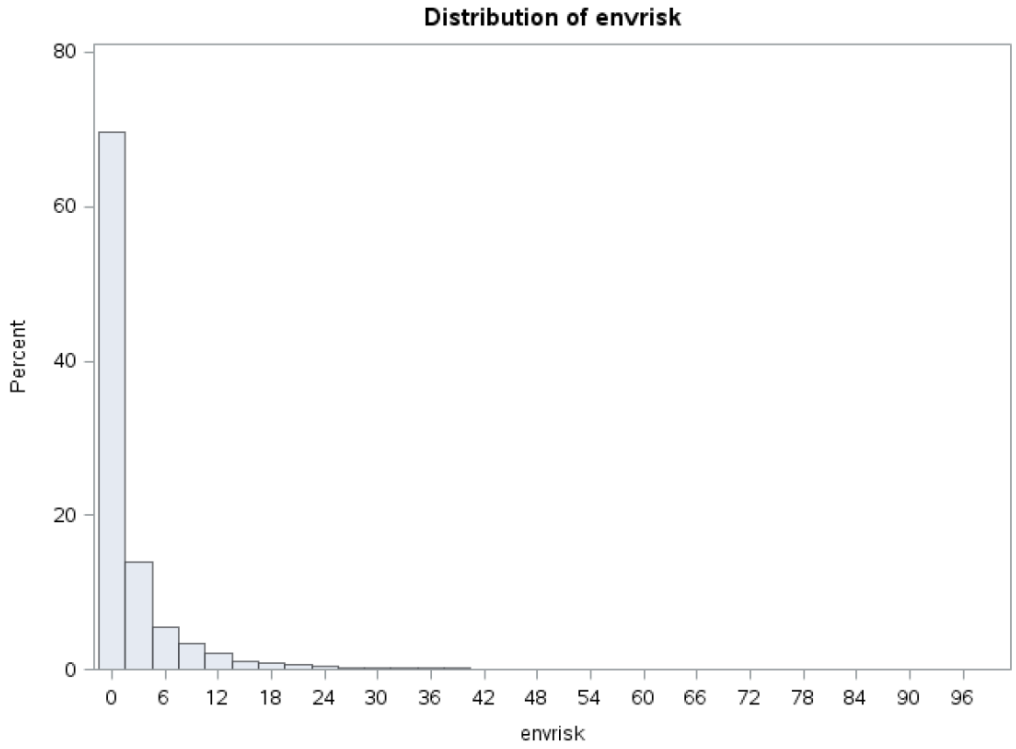
Carbon risk intelligence: two empirical studies at the Bank of Italy

1. How **does hydrogeological risk affect credit supply to firms** (Faiella and Natoli, *Natural catastrophes and bank lending: the case of flood risk in Italy*, Occasional paper n. 457, Oct. 2018) → Physical risk
2. How **carbon risk is affecting the value of European utilities generating electricity** (Bernardini, Di Giampaolo, Faiella and Poli, *Gli investimenti nelle utilities del settore elettrico: implicazioni del carbon risk*, Occasional paper n. 410, Nov. 2017) → Transition risk

Does natural catastrophe risk affect Banks' lending propensity?

Catastrophe risk and bank lending

- Investigation of the disaster risk borne by the banking sector, studying the case of Italian banks dealing with flood risk.
- Measure of disaster risk is the share of firms at risk of floods per municipality.
- We define **High-Impact Flooding (HIF) municipalities** those with a percentage of exposed firms higher than the 75th percentile exposure rate.



Catastrophe risk and bank lending

- Stock of loans in 2014: 776 bln euros, of which 23% in HIF municipalities
- The bulk of business loans at risk located in Lombardia, Veneto, Emilia Romagna and Tuscany, high-value-added regions

Region	LIF	HIF	Total
Abruzzo	9.763	1.037	10.801
Basilicata	2.040	18	2.059
Calabria	2.531	1.785	4.316
Campania	25.030	1.733	26.763
Emilia-Romagna	52.734	26.091	78.825

Province fixed effects	Yes					
R-square	0.162					

Table 7: Regression of PL on CatRisk and controls. PL and CatRisk are in natural logarithm. Standard errors are clustered at province level (108 clusters). Observations are 69,232.

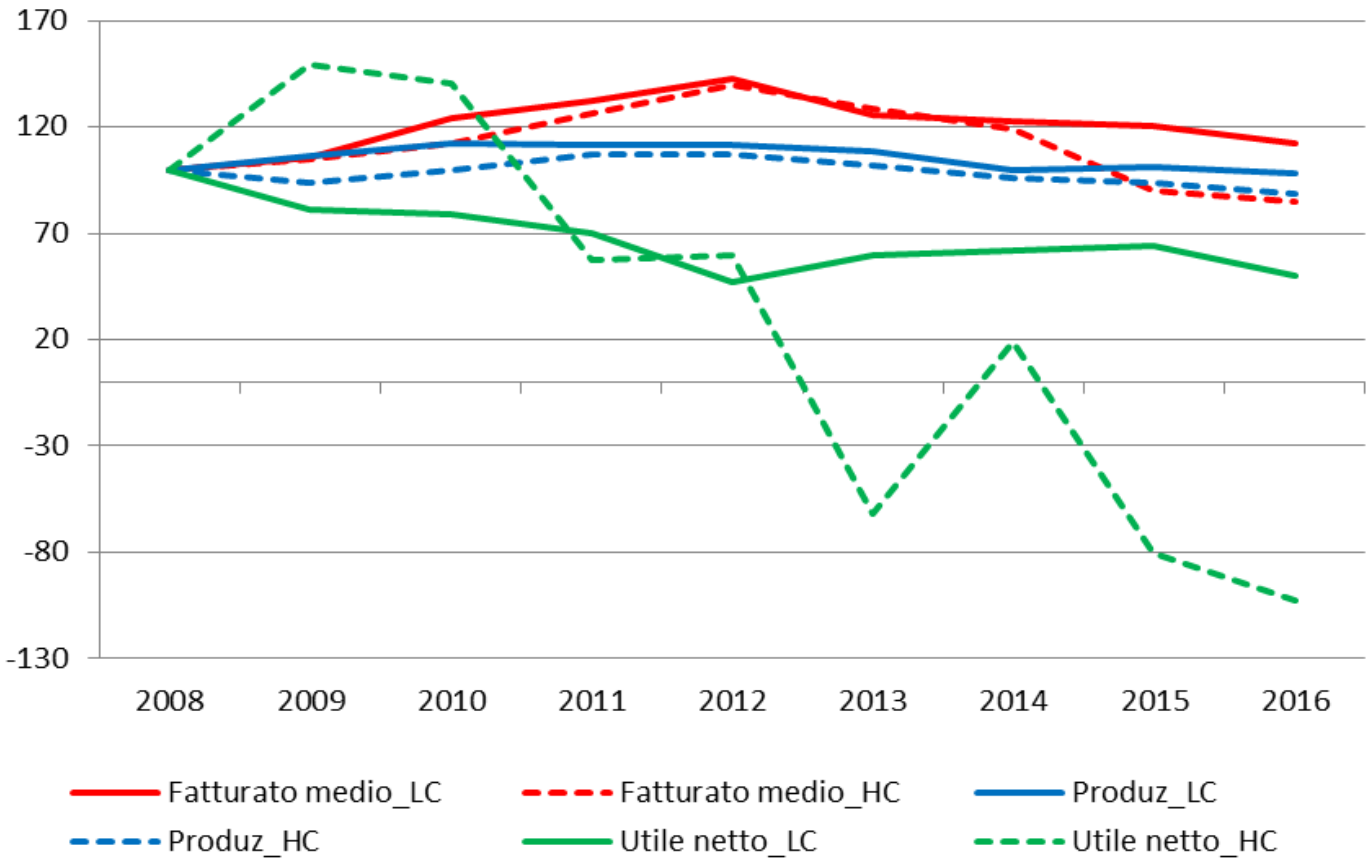
How does carbon risk affect the value of European Energy Utilities?

Gli investimenti nelle utilities del settore elettrico: implicazioni del *carbon risk*

1. Analysis of 13 electricity-generating utilities (UEN) listed in the Stoxx 600 Europe index. 55% of utilities sector capitalization, 48% of the EU's 2016 production and 15.4% of greenhouse gas emissions in the EU in 2015.
2. The analysis was conducted on the basis of production, emission, economic and financial data and market performance data **for the period 2008-2016**, for which homogenous data were reconstructed.
3. UENs have been divided into **two groups according to a carbon intensity index** (based on the carbon intensity of energy production) that is influenced not only by the quantities produced but also by the energy mix adopted.

Gli investimenti nelle utilities del settore elettrico: implicazioni del *carbon risk*

Turnover, production and net profit (Index 2008 = 100)



Gli investimenti nelle utilities del settore elettrico: implicazioni del *carbon risk*

Two competing portfolios (HC and LC) and their difference (LMH)
(Index 31 dec 2005= 100)
